V.I. Afonso, E. Orazi, D. Rubiera-Garcia

Motivations

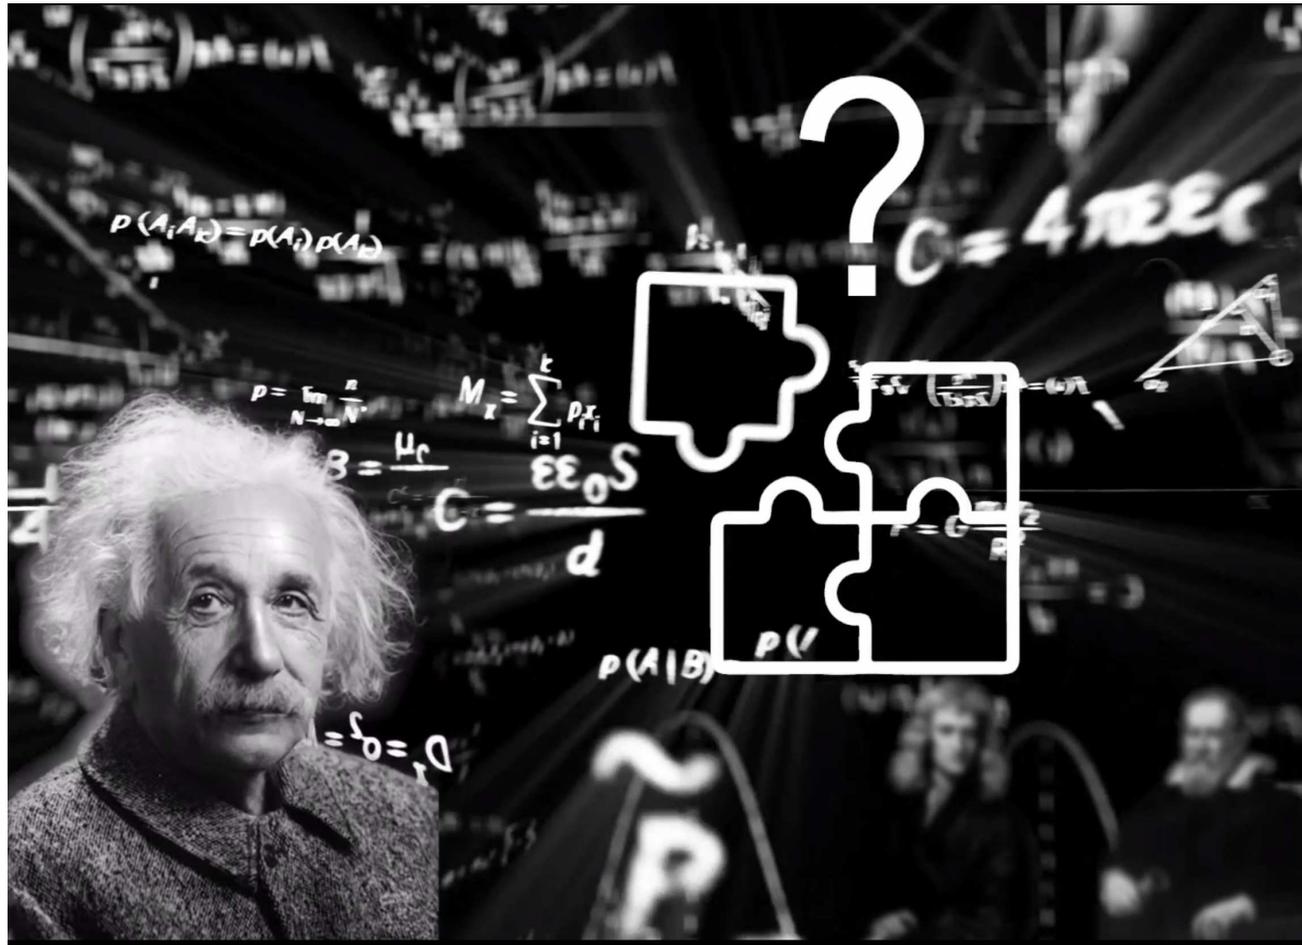

● Motivations I

Metric-Affine Modified Gravity

RBGs

Conclusions

The End

- Cosmological observations **confirm many aspects** of Λ CDM.
- But some pieces in the jigsaw do not fit well.
- Extensions of the matter sector seem natural.
- The gravitational side might also need some changes.

Motivations

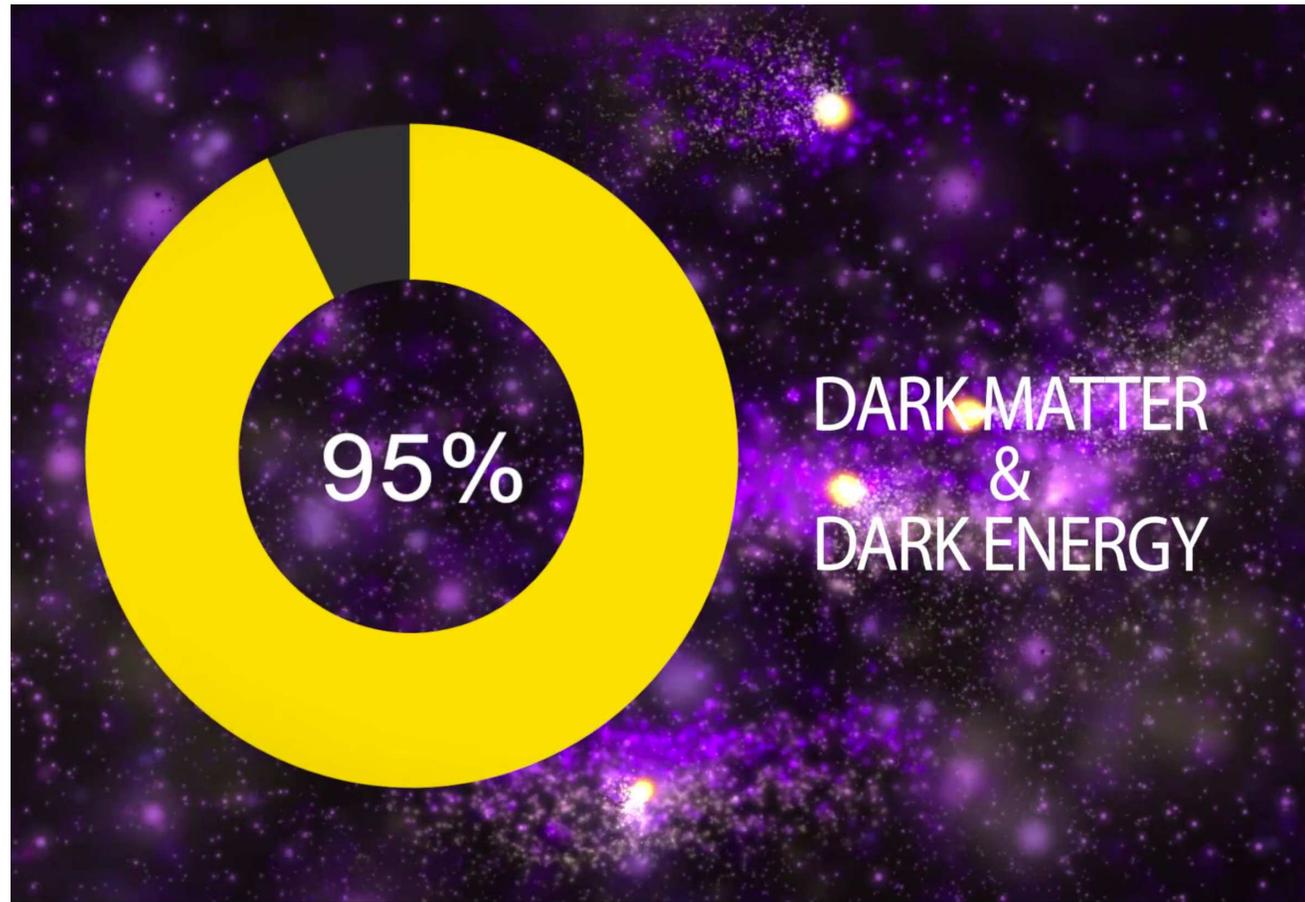

● Motivations I

Metric-Affine Modified Gravity

RBGs

Conclusions

The End

- CMB finds $H_0 = 67$ while local measurements coincide in $H_0 = 73$.
- Dynamical dark energy or new gravitational dynamics at large scales (infrared)?
- What drives the cosmic expansion?

Motivations

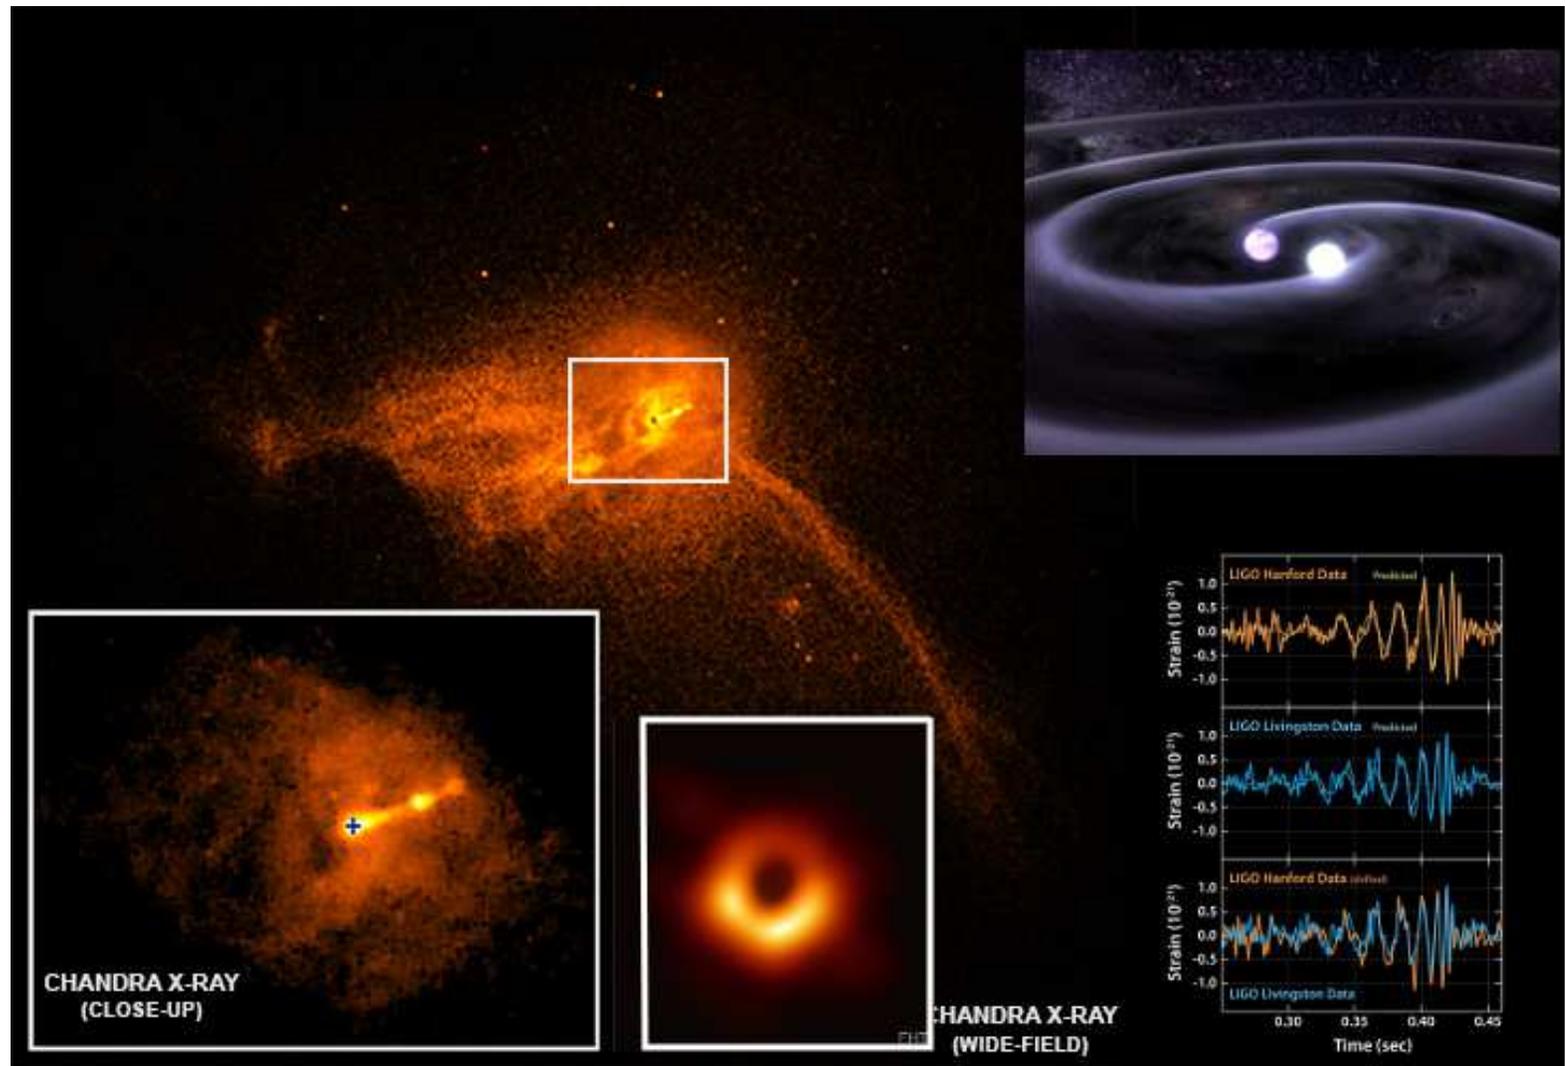

● Motivations I

Metric-Affine Modified Gravity

RBGs

Conclusions

The End

- Astrophysical properties of BHs have been verified.
- Conceptual problems remain: notion of singularity, Hawking radiation, ...

Motivations

- Gravitational wave astronomy and VLBI techniques pose new challenges:

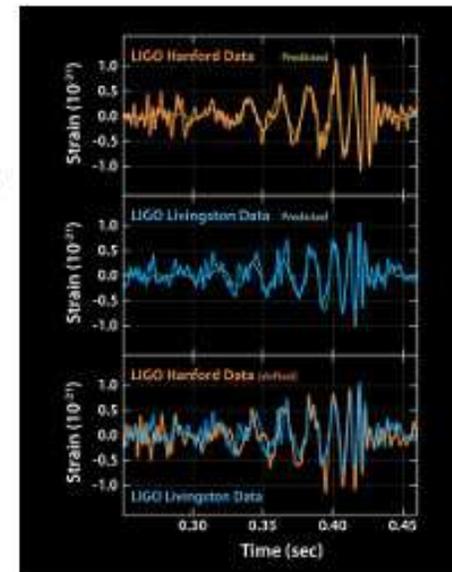

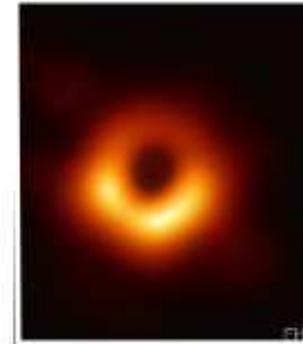

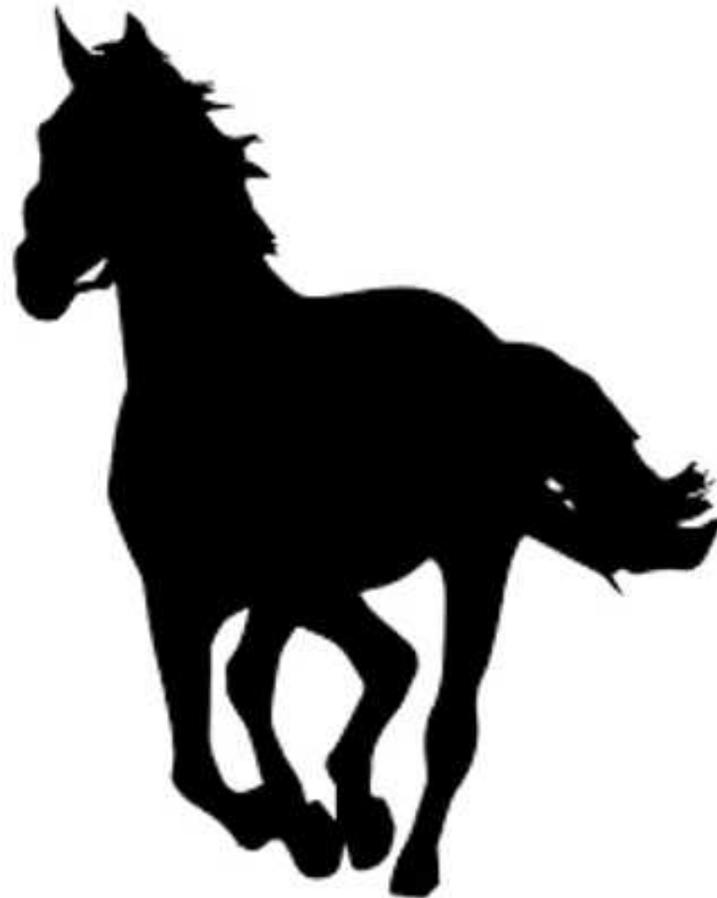

● Motivations I

Metric-Affine Modified Gravity

RBGs

Conclusions

The End

Motivations

- Gravitational wave astronomy and VLBI techniques pose new challenges:

- Nature could bring surprises in unexpected ways!
- New exact solutions are necessary to parametrize deviations from GR.

● Motivations I

Metric-Affine Modified Gravity

RBGs

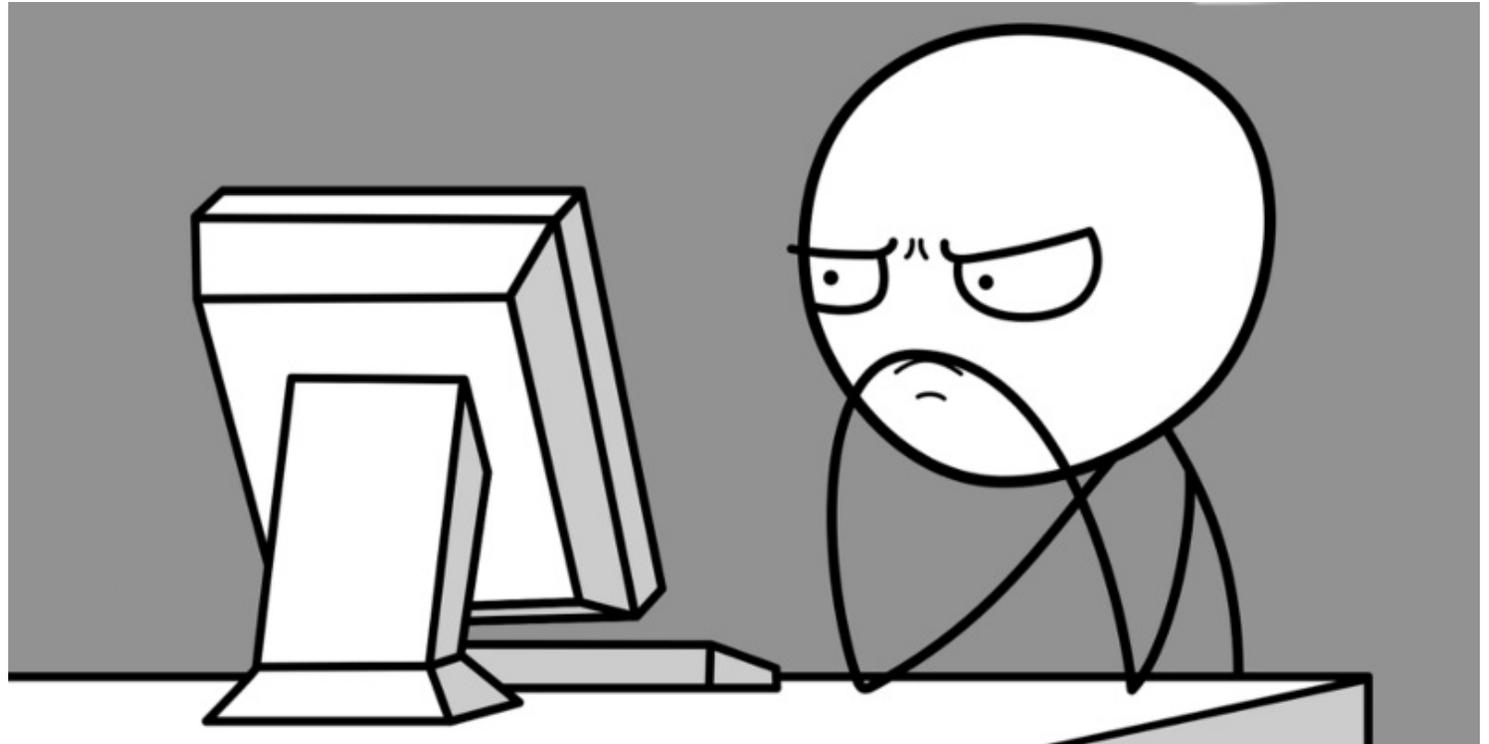

Conclusions

The End

Motivations

- Going beyond GR is a computational challenge:

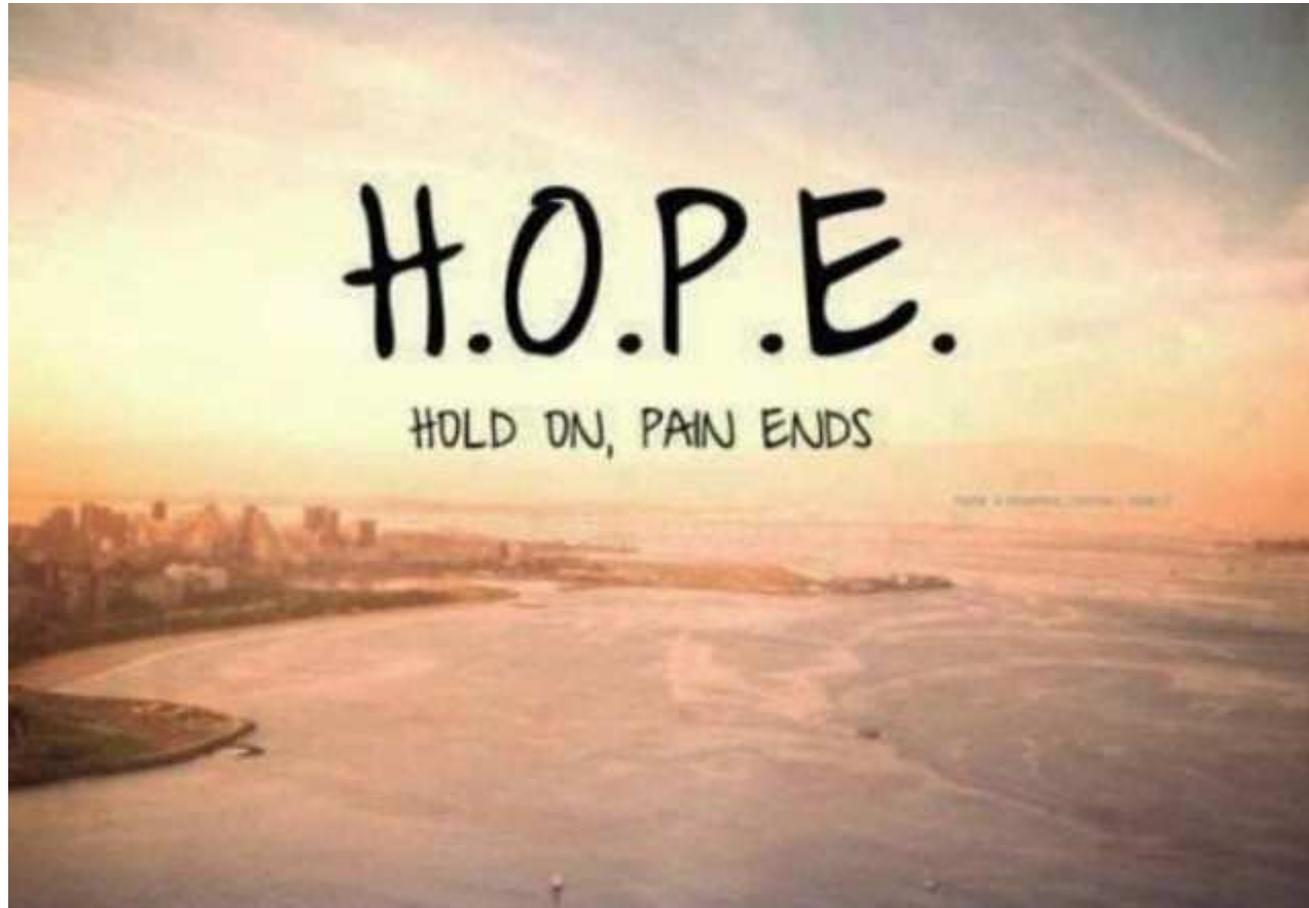

- We must build bridges between **modified gravity** and **GW astronomy/numerical relativity**.

Motivations

- There is hope for progress in certain families of modified theories of gravity:

- Numerical and analytical methods can be successfully implemented in metric-affine gravity theories

● Motivations I

Metric-Affine Modified Gravity

- Space-time microstructure
- Lessons from CMI
- MA geometries
- Metric-Affine - Vs - Metric

RBGs

Conclusions

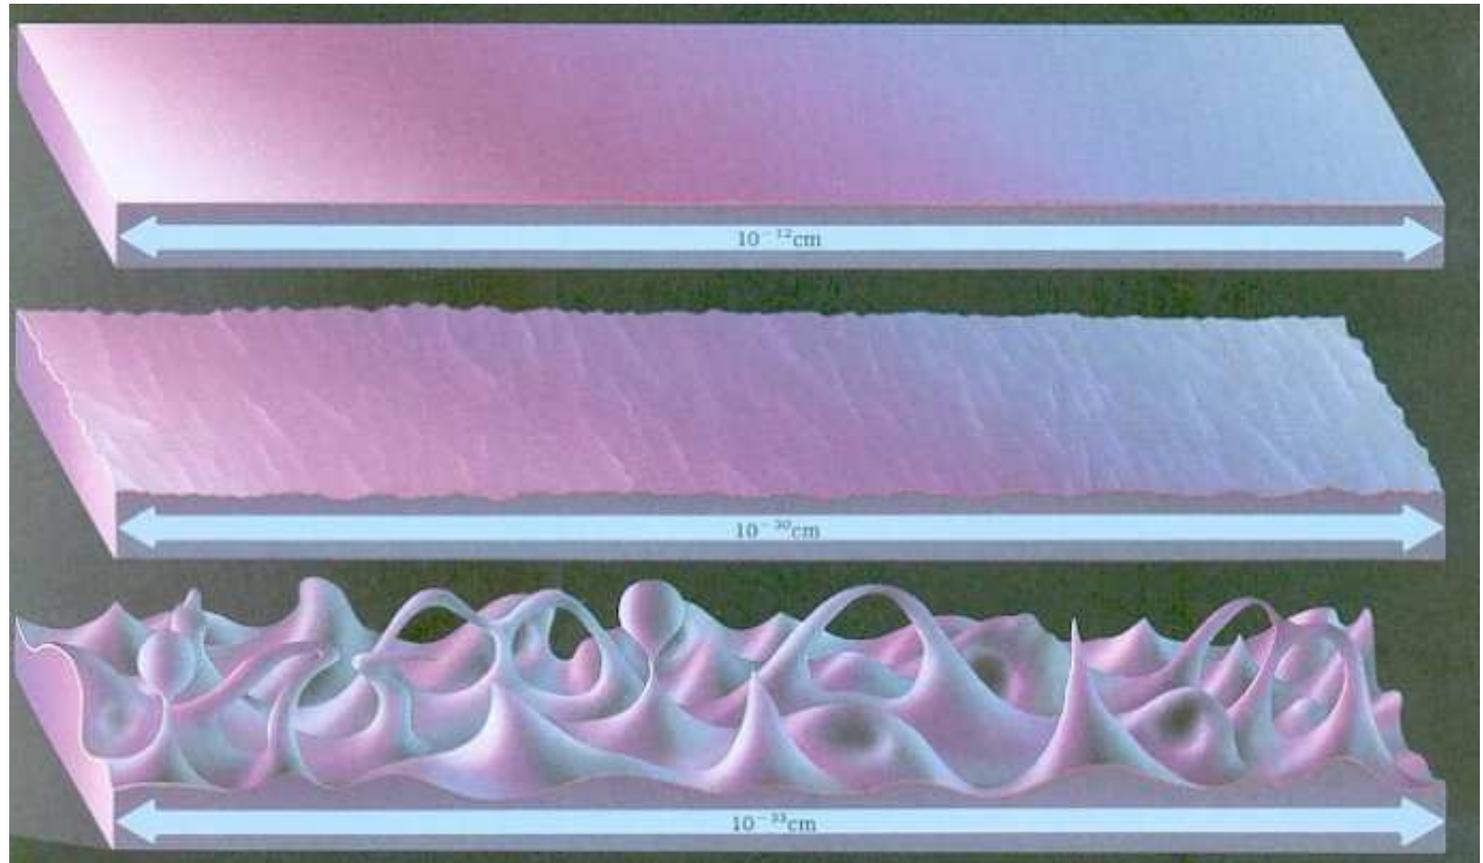

The End

Metric-Affine Modified Gravity

Space-time microstructure

- If topology change could occur dynamically:
 - ◆ The **smoothness of Minkowski space disappears** at Planckian scales.
 - ◆ Quantum fluctuations would lead to **creation/annihilation of wormholes**.
 - ◆ Fluxes through wormholes appear as pairs of elementary particles.

● Motivations I

Metric-Affine Modified Gravity

● MA geometries

● Metric-Affine - Vs - Metric

RBGs

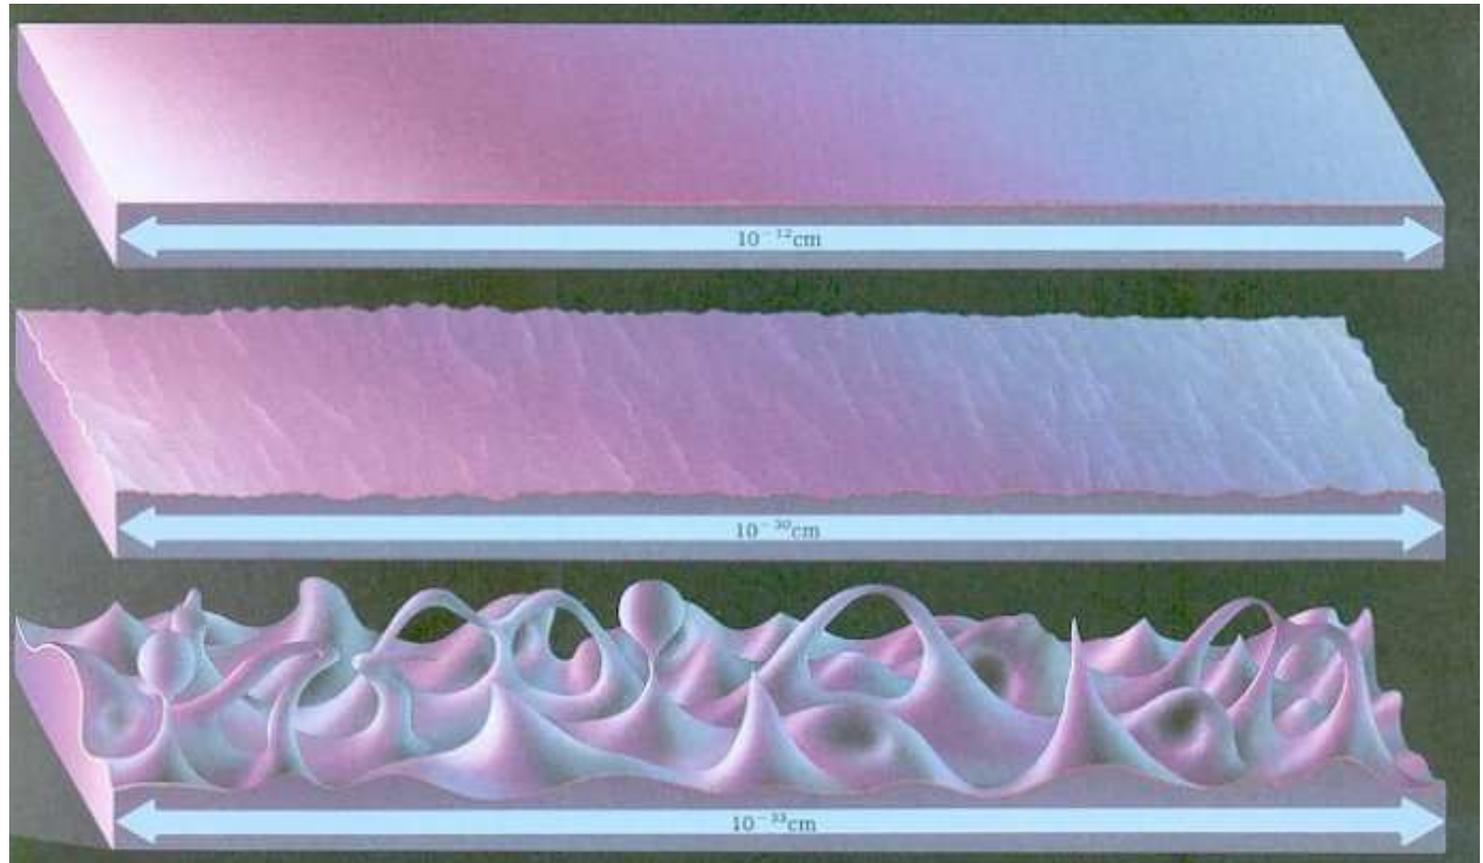

Conclusions

The End

Space-time microstructure

- If topology change could occur dynamically:
 - ◆ The **smoothness of Minkowski space disappears** at Planckian scales.
 - ◆ Quantum fluctuations would lead to **creation/annihilation of wormholes**.
 - ◆ Fluxes through wormholes appear as pairs of elementary particles.

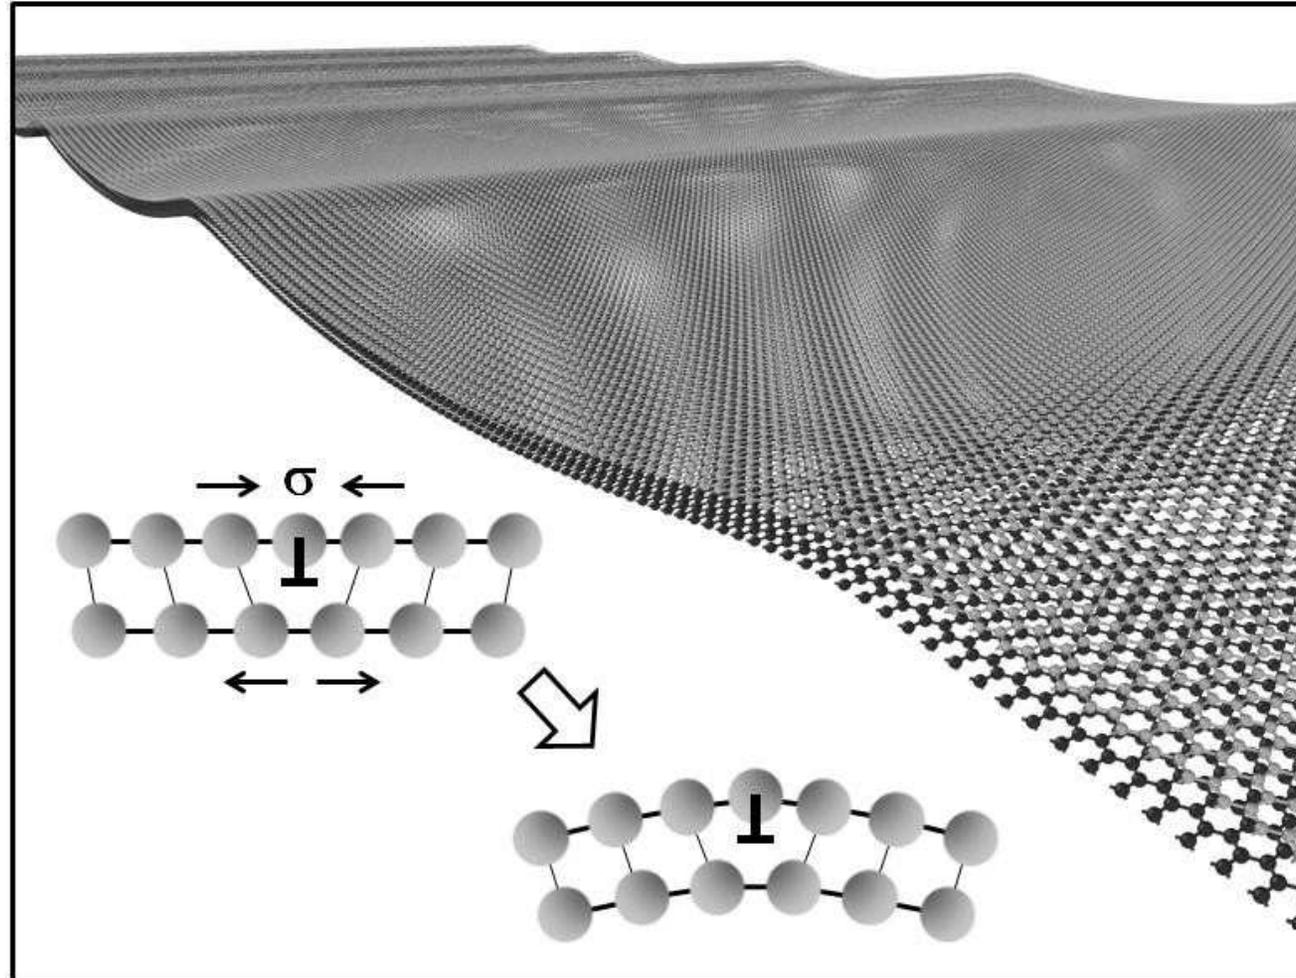

- **What kind of framework** should we use to describe this scenario?

Lessons from Condensed Matter Physics

- A **microstructure** with a **macroscopic continuum limit** is found in condensed matter systems such as **graphene** or **Bravais crystals**.

- ◆ Wave propagation on the **continuum effective geometry** of bilayer graphene.

● Motivations I

Metric-Affine Modified Gravity

● Space-time microstructure

● Lessons from CM I

● MA geometries

● Metric-Affine - Vs - Metric

RBGs

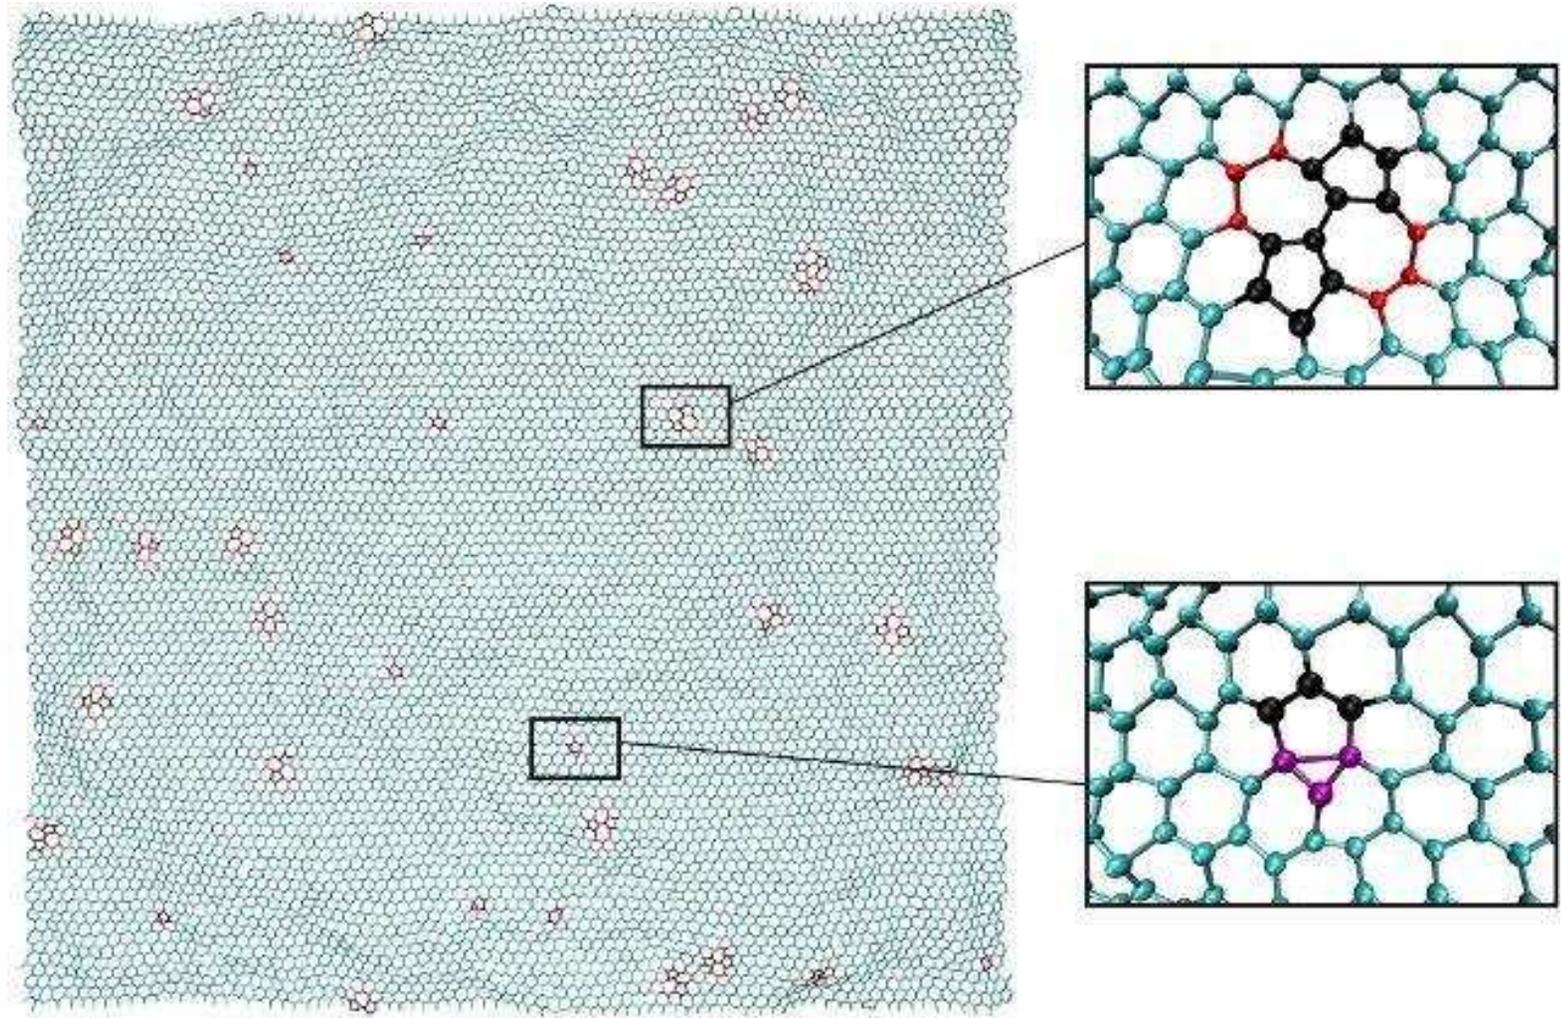

Conclusions

The End

Lessons from Condensed Matter Physics

- A **microstructure** with a **macroscopic continuum limit** is found in condensed matter systems such as **graphene** or **Bravais crystals**.

- ◆ Microscope image of a graphene layer with defects.

● Motivations I

Metric-Affine Modified Gravity

● Space-time microstructure

● Lessons from CM I

● MA geometries

● Metric-Affine - Vs - Metric

RBGs

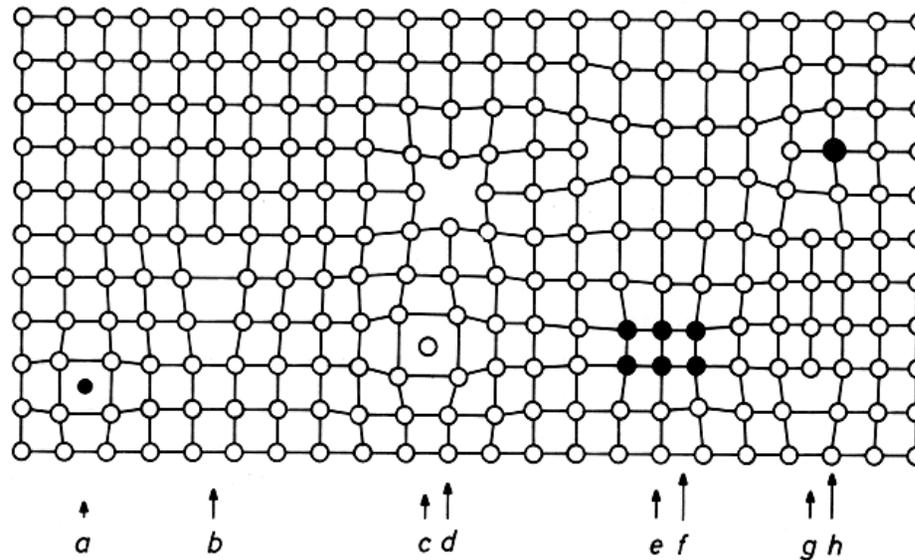

Conclusions

The End

Metric-Affine geometries do exist in Nature

- A **microstructure** with a **macroscopic continuum limit** is found in condensed matter systems such as **graphene** or **Bravais crystals**.
- Crystalline structures may have **different kinds of defects**:

- a) Interstitial impurity atom, b) Edge dislocation, c) Self interstitial atom
 d) Vacancy, e) Precipitate of impurity atoms, f) Vacancy type dislocation loop,
 g) Interstitial type dislocation loop, h) Substitutional impurity atom

- ◆ Point defects are related with non-metricity: $Q_{\alpha\mu\nu} = \nabla_{\alpha}^{\Gamma} g_{\mu\nu} \neq 0$.
- ◆ Dislocations (1D defects) generate torsion: $\Gamma_{\mu\nu}^{\alpha} \neq \Gamma_{\nu\mu}^{\alpha}$
- ◆ **Metric-affine geometry** could help better understand the transition from **Quantum Gravity** to **classical space-time**.

● Motivations I

Ricci-Based Gravity theories

Ricci-Based Gravity theories (RBGs)

■ In GR replace $g^{\mu\nu} R_{\mu\nu}(\Gamma) \Rightarrow L_G[g^{\mu\alpha} R_{(\alpha\nu)}(\Gamma)]$

◆ The connection can be solved as Levi-Civita of an auxiliary metric:

$$\Gamma_{\alpha\beta}^{\mu} = \frac{h^{\mu\rho}}{2} (\partial_{\alpha} h_{\rho\beta} + \partial_{\beta} h_{\rho\alpha} - \partial_{\rho} h_{\alpha\beta}) .$$

◆ The two metrics are related by: $h_{\alpha\beta} = g_{\alpha\rho} \Omega^{\rho}_{\beta}$.

◆ $\Omega^{\rho}_{\beta} = \Omega^{\rho}_{\beta}(T^{\mu}_{\nu})$ is a nonlinear function of the matter fields.

◆ The metric field equations can be generically written as:

$$G^{\mu}_{\nu}(h) = \frac{\kappa^2}{|\Omega|^{1/2}} \left[T^{\mu}_{\nu} - \delta^{\mu}_{\nu} \left(L_G + \frac{T}{2} \right) \right] .$$

Ricci-Based Gravity theories (RBGs)

■ In GR replace $g^{\mu\nu} R_{\mu\nu}(\Gamma) \Rightarrow L_G[g^{\mu\alpha} R_{(\alpha\nu)}(\Gamma)]$

◆ The connection can be solved as Levi-Civita of an auxiliary metric:

$$\Gamma_{\alpha\beta}^{\mu} = \frac{h^{\mu\rho}}{2} (\partial_{\alpha} h_{\rho\beta} + \partial_{\beta} h_{\rho\alpha} - \partial_{\rho} h_{\alpha\beta}) .$$

◆ The two metrics are related by: $h_{\alpha\beta} = g_{\alpha\rho} \Omega^{\rho}_{\beta}$.

◆ $\Omega^{\rho}_{\beta} = \Omega^{\rho}_{\beta}(T^{\mu}_{\nu})$ is a nonlinear function of the matter fields.

◆ The metric field equations can be generically written as:

$$G^{\mu}_{\nu}(h) = \frac{\kappa^2}{|\Omega|^{1/2}} \left[T^{\mu}_{\nu} - \delta^{\mu}_{\nu} \left(L_G + \frac{T}{2} \right) \right] .$$

■ These theories generically recover GR+ Λ in vacuum:

◆ Only **two propagating d.o.f.** which travel at the speed of light.

◆ Weak-field limit satisfied (unless anomalous behavior at low curvatures).

◆ $h_{\mu\nu}$ is sensitive to the **total energy** content.

◆ $g_{\mu\nu}$ also feels the **local energy-densities** $\Rightarrow \nabla^{\Gamma}_{\alpha} g_{\mu\nu} \neq 0$.

◆ $Q_{\alpha\mu\nu} = \nabla^{\Gamma}_{\alpha} g_{\mu\nu} \neq 0$ generated by **stress-energy densities** \leftrightarrow **crystal defects**.

Conclusions

The End

- Consider $f(R) = R - \sigma R^2$ coupled to $L_m(X) = X$, with $X = g^{\mu\nu} \partial_\mu \phi \partial_\nu \phi$.
 - ◆ The map to GR leads to $\tilde{L}_m(Z) = Z + \sigma \kappa^2 Z^2$, with $Z = q^{\mu\nu} \partial_\mu \phi \partial_\nu \phi$.
 - ◆ Thus **quadratic $f(R)$ plus free scalar** leads to **GR plus quadratic scalar**.
- Consider the map from GR with $K(Z, \phi) = Z - 2V(\phi)$ to $f(R) = R - \sigma R^2$
 - ◆ The map leads to $P(X, \phi) = \frac{X - \sigma \kappa^2 X^2}{1 - 8\sigma \kappa^2 V(\phi)} - \frac{2V(\phi)}{1 - 8\sigma \kappa^2 V(\phi)}$
 - ◆ In the purely kinetic case: $P(X) = X - \sigma \kappa^2 X^2$
 - ◆ Thus **GR plus free scalar** leads to **quadratic $f(R)$ plus quadratic scalar**.
 - ◆ Transforming back this $P(X, \phi)$ model to GR one recovers $Z - 2V(\phi)$.

Example: Born-Infeld gravity+fluids

■ Let us focus on $\mathcal{S}_{EiBI} = \frac{1}{\kappa^2 \epsilon} \int d^4x \left[\sqrt{|g_{\mu\nu} + \epsilon R_{(\mu\nu)}|} - \lambda \sqrt{-g} \right]$ with a fluid

◆ In this theory $|\hat{\Omega}|^{\frac{1}{2}} [\Omega^{-1}]^\mu{}_\nu = \lambda \delta^\mu{}_\nu - \epsilon \kappa^2 T^\mu{}_\nu$ and $\mathcal{L}_{EiBI} = (|\hat{\Omega}|^{\frac{1}{2}} - \lambda) / \epsilon \kappa^2$

- Scalar compact object in GR
- Mapping into $f(R)$
- Mapping into EiBI

Conclusions

The End

Example: Born-Infeld gravity+fluids

- Let us focus on $S_{EiBI} = \frac{1}{\kappa^2 \epsilon} \int d^4x \left[\sqrt{|g_{\mu\nu} + \epsilon R_{(\mu\nu)}|} - \lambda \sqrt{-g} \right]$ with a fluid

◆ In this theory $|\hat{\Omega}|^{\frac{1}{2}} [\Omega^{-1}]^\mu{}_\nu = \lambda \delta^\mu{}_\nu - \epsilon \kappa^2 T^\mu{}_\nu$ and $\mathcal{L}_{EiBI} = (|\hat{\Omega}|^{\frac{1}{2}} - \lambda) / \epsilon \kappa^2$

- Using the Einstein-frame variables, $\tilde{T}^\mu{}_\nu$, the deformation matrix becomes:

$$[\Omega^{-1}]^\mu{}_\nu = \left(1 - \frac{\epsilon \kappa^2}{2} [\tilde{\rho} - \tilde{p}_r] \right) \delta^\mu{}_\nu - \epsilon \kappa^2 (\tilde{\rho} + \tilde{p}_\perp) v^\mu v_\nu - \epsilon \kappa^2 (\tilde{p}_r - \tilde{p}_\perp) \xi^\mu \xi_\nu$$

- Given that $g_{\mu\nu} = h_{\mu\alpha} [\Omega^{-1}]^\alpha{}_\nu$, we find:

$$g_{\mu\nu} = \left(1 - \frac{\epsilon \kappa^2}{2} [\tilde{\rho} - \tilde{p}_r] \right) h_{\mu\nu} - \epsilon \kappa^2 (\tilde{\rho} + \tilde{p}_\perp) v_\mu v_\nu - \epsilon \kappa^2 (\tilde{p}_r - \tilde{p}_\perp) \xi_\mu \xi_\nu$$

Once a solution for an anisotropic fluid is known in GR, this generates **new solutions in the Born-Infeld gravity theory.**

■ As $z \rightarrow \infty$: $\pm E\lambda(z) \approx z \approx x$.

■ As $z \rightarrow 1$:

$$\pm E\lambda(z) \approx -\frac{1}{\sqrt{2\alpha+2}\sqrt{z-1}} \approx -\frac{1}{|\tilde{x}|}$$

■ Geodesically complete space.

NEDs in $f(R) = R - \sigma R^2$

$$f(R) = R - \sigma R^2 \quad \rho = \frac{\rho_m}{z^4 - s_\beta}$$

	Wormhole	Metric components	Energy density	Curvature scalars	Geodesics
Case I ($\sigma > 0, \beta < 0$)	YES if $\gamma > 1$ NO if $\gamma < 1$	Divergent	Finite	Divergent	Complete if $\gamma > 1$ Incomplete if $\gamma < 1$
Case II ($\sigma > 0, \beta > 0$)	NO	Finite	Divergent	Finite	Incomplete
Case III ($\sigma < 0, \beta < 0$)	NO	Divergent if $\delta_1 \neq \delta_c^{(\gamma)}$ Finite if $\delta_1 = \delta_c^{(\gamma)}$	Finite	Divergent if $\delta_1 \neq \delta_c^{(\gamma)}$ Finite if $\delta_1 = \delta_c^{(\gamma)}$	Incomplete? if $\delta_1 > \delta_c^{(\gamma)}$ Complete if $\delta_1 = \delta_c^{(\gamma)}$ (de Sitter core) Incomplete if $\delta_1 < \delta_c^{(\gamma)}$
Case IV ($\sigma < 0, \beta > 0$)	YES	Divergent	Finite	Divergent	Complete

Table I. Summary of the features of the four families of configurations studied in Sec. V (the case $\{\sigma > 0, \beta < 0\}$ with $\gamma = 1$ hides some peculiarities, see Sec. VA, so it is not contained in this table). The metric components, energy density and curvature scalars refers to the behaviour at the wormhole throat (when it exists) or otherwise at the innermost region of the solutions. Incomplete geodesics refer to the existence of (at least) a single incomplete null or timelike geodesic curve. The breakdown of the correlations among these three concepts is clear.

In GR geodesic incompleteness occurs simultaneously with curvature and matter divergences. This degeneracy is broken beyond GR.

Conclusions

The End

- Wyman (PRD24,1981) obtained an exact, asymptotically flat, free scalar field solution:

$$◆ \quad ds_{GR}^2 = -e^{\nu} dt^2 + \frac{e^{\nu}}{W^4} dy^2 + \frac{1}{W^2} (d\theta^2 + \sin^2 \theta d\phi^2)$$

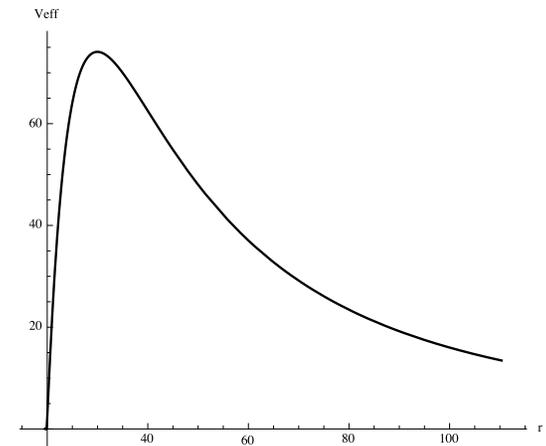

- ◆ Here $\square\phi = 0$ becomes $\phi_{yy} = 0 \Rightarrow \phi = y$.

$$◆ \quad e^{\nu} = e^{\beta y}, \quad W = e^{\beta y/2} \sinh(\gamma y)/\gamma,$$

$$◆ \quad \gamma \equiv \sqrt{\beta^2 + 2\kappa^2/2} \quad \text{and} \quad \beta = -2M.$$

- Properties of this solution:

- ◆ The far limit is $y \rightarrow 0$, where $W \approx y$.
- ◆ Energy density concentrated inside the Schwarzschild radius.
- ◆ **No event horizon** but an **ISCO** at $\sim 3M$.
- ◆ Geodesics reach the center in finite affine time.
- ◆ Strong curvature divergence at the center.
